

## Activity Selection Problem

Given **N** activities with their start and finish day given in array **start[ ]** and **end[ ]**. Select the maximum number of activities that can be performed by a single person, assuming that a person can only work on a single activity at a given day.

**Note :** Duration of the activity includes both starting and ending day.

### Example 1:

**Input:**

N = 2

start[] = {2, 1}

end[] = {2, 2}

**Output:**

1

**Explanation:**

A person can perform only one of the given activities.

### Example 2:

**Input:**

N = 4

start[] = {1, 3, 2, 5}

end[] = {2, 4, 3, 6}

**Output:**

3

**Explanation:**

A person can perform activities 1, 2 and 4.

## Activity Selection Problem

The activity selection problem is a mathematical optimization problem. Our first illustration is the problem of scheduling a resource among several challenge activities. We find a greedy algorithm provides a well designed and simple method for selecting a maximum- size set of manually compatible activities.

Suppose  $S = \{1, 2, \dots, n\}$  is the set of  $n$  proposed activities. The activities share resources which can be used by only one activity at a time, e.g., Tennis Court, Lecture Hall, etc. Each Activity " $i$ " has **start time**  $s_i$  and a **finish time**  $f_i$ , where  $s_i \leq f_i$ . If selected activity " $i$ " take place meanwhile the half-open time interval  $[s_i, f_i)$ . Activities  $i$  and  $j$  are **compatible** if the intervals  $(s_i, f_i)$  and  $[s_j, f_j)$  do not overlap (i.e.  $i$  and  $j$  are compatible if  $s_i \geq f_j$  or  $s_j \geq f_i$ ). The activity-selection problem chosen the maximum- size set of mutually consistent activities.

### Algorithm Of Greedy- Activity Selector:

#### GREEDY- ACTIVITY SELECTOR ( $s, f$ )

1.  $n \leftarrow \text{length}[s]$
2.  $A \leftarrow \{1\}$
3.  $j \leftarrow 1$ .
4. for  $i \leftarrow 2$  to  $n$
5. do if  $s_i \geq f_j$
6. then  $A \leftarrow A \cup \{i\}$
7.  $j \leftarrow i$
8. return  $A$

**Example:** Given 10 activities along with their start and end time as

$S = (A_1 A_2 A_3 A_4 A_5 A_6 A_7 A_8 A_9 A_{10})$

$S_i = (1, 2, 3, 4, 7, 8, 9, 9, 11, 12)$

$f_i = (3, 5, 4, 7, 10, 9, 11, 13, 12, 14)$

Compute a schedule where the greatest number of activities takes place.

Current TimeÂ 0:03

**Solution:** The solution to the above Activity scheduling problem using a greedy strategy is illustrated below:

Arranging the activities in increasing order of end time

Activity	A <sub>1</sub>	A <sub>3</sub>	A <sub>2</sub>	A <sub>4</sub>	A <sub>6</sub>	A <sub>5</sub>	A <sub>7</sub>	A <sub>9</sub>	A <sub>8</sub>	A <sub>10</sub>
Start	1	3	2	4	8	7	9	11	9	12
Finish	3	4	5	7	9	10	11	12	13	14

Now, schedule A<sub>1</sub>

Next schedule A<sub>3</sub> as A<sub>1</sub> and A<sub>3</sub> are non-interfering.

Next **skip** A<sub>2</sub> as it is interfering.

Next, schedule A<sub>4</sub> as A<sub>1</sub> A<sub>3</sub> and A<sub>4</sub> are non-interfering, then next, schedule A<sub>6</sub> as A<sub>1</sub> A<sub>3</sub> A<sub>4</sub> and A<sub>6</sub> are non-interfering.

Skip A<sub>5</sub> as it is interfering.

Next, schedule A<sub>7</sub> as A<sub>1</sub> A<sub>3</sub> A<sub>4</sub> A<sub>6</sub> and A<sub>7</sub> are non-interfering.

Next, schedule A<sub>9</sub> as A<sub>1</sub> A<sub>3</sub> A<sub>4</sub> A<sub>6</sub> A<sub>7</sub> and A<sub>9</sub> are non-interfering.

Skip A<sub>8</sub> as it is interfering.

Next, schedule A<sub>10</sub> as A<sub>1</sub> A<sub>3</sub> A<sub>4</sub> A<sub>6</sub> A<sub>7</sub> A<sub>9</sub> and A<sub>10</sub> are non-interfering.

Thus the final Activity schedule is:

$$(A_1 \ A_3 \ A_4 \ A_6 \ A_7 \ A_9 \ A_{10})$$
